WHEEL WASH STATEMENT

A wheel wash facility will be temporary located at the main site entrance gates, and consists of a pressured water jet, which is powered by the mains water supply.

As the ground works / construction works will run throughout the winter months the main drainage and access road will be completed amongst the first site operations up to and including the base course tarmac level as required. This ensures that all delivery lorries will remain on a road surface. By using the wheel wash facility as previously described, which will drain into temporary gullies, we do not envisage that mud will be taken out onto the public highway causing a disruption to local residents and the environment.

As a standard operating site procedure the site access road, and surrounding estate roads which are adjacent to the site boundary, these will be cleaned on a regular / requirement basis, using a mobile road sweeper throughout the course of the construction phase.
