

S706 70mm profile is available across our entire range of replacement double glazed windows, doors, patios, porches and conservatories.

As a market leader, these profiles provide you with a whole host of benefits.

Traditional Window Appearance

The deep chamfers on our windows have been carefully designed to replicate the putty line of a timber window. This gives all the advantages of PVC-U, while maintaining a traditional appearance, particularly if you choose the warm mahogany or golden oak woodgrain finish.

Fit Them And Forget Them

You really couldn't get anything requiring less maintenance than our windows! They don't need painting, so they don't warp, flake or peel. Just occasionally oil the hinges and locks and gently rub the frames over with a mild detergent to keep them at their best.

Excellent Thermal Insulation Saves You Money

PVC-U is a very poor conductor of heat and therefore makes an excellent insulator. In the construction industry, a material's U-value measures its ability to insulate, with the lower the value, the better the insulant. A typical old single glazed window has a U-value of approximately 4.4W/m²K.

REHAU frames have been tested and proven to have a U-value of 2.6W/m²K, meaning our frames keep in nearly 60% more heat than typical older frames. This conserves energy and more importantly saves you money on your heating bill.

Soundproofing Offers You Peace And Quiet

Under test, a double glazed window made with REHAU profiles will achieve a rating of 30-40dB (decibels). Typical ambient sound measures around 60dB in suburban conditions, so your new windows will more than halve the noise, allowing you to relax undisturbed.
