DETERMINED PLAN

BACKGROUND: - Removal of existing signs may expose a sub-fascia in poor condition. The new signs may not cover entirely the exposed background; it is down to the dealer to make good the building (unless blank panels have been allowed for in the quotation) either prior to or after the new signage installation.

- External Wall signs require an electrical feed placed directly out of the where the sign is going to be situated. The feed will need to run through building to the exterior and have an inline Fused Spur.

-External Free standing signs require an electrical feed placed directly out of the ground where the sign is being installed. The electrical supply needs to be above ground level and should be an Armoured Cabled suitably terminated with either an armoured gland or Junction Box. Floodlights will require a suitable electrical supply such as 3 core flexible cable.

Should this not be in place at the time installation, the tail of the electrical cable will be left out by the crew. It will be your responsibility to get others to connect the signs at a later date.

Proposed views are only for indicative purposes only.
