

Reducing dirt and waste leaving the site

Add to my saved searches

Clean vehicles and plant will present a positive image of the site, company and construction industry.

Maintaining clean vehicles will also help to prevent mud and dirt on the surrounding roads.

Not only will the materials produce dirt and mud in public spaces, which will create a negative impression of the site, but some of these materials could potentially contain harmful substances, that should not be outside of the construction site.

It is therefore important to eliminate the amount of dirt and waste that could leave the site.

A number of sites have:

- Replaced the old wheel wash facility with jet washing arrangements, to ensure no spoil transference to adjoining roads and highways;
- Protected all drainage around the building and contained the runoff from the jet washing process;
- Internal roads within the site were laid with hardstanding surface to relieve problems with muddy roads.
