ARCHAEOLOGICAL MONITORING AND RECORDING

SUMMARY

A programme of archaeological monitoring and recording was undertaken by Witham Archaeology during groundworks relating to the construction of a single four bedroom dwelling. The work was commissioned by Mr. N Price to meet the requirements of a condition attached to planning permission granted by South Holland District Council.

Previous archaeological work in the surrounding area had revealed a Romano British settlement immediately to the south of the site and an undated ditch was recorded during archaeological monitoring approximately 600m to the west of the site. To the north, cropmarks of probable Iron Age and Romano British date have been identified in aerial photographs. During the early Roman period the area was heavily utilised for salt production.

The programme of monitoring and recording at Land West of Bank House Farm, South Eau Bank, Throckenholt revealed two possible pits and a ditch running across site. A peat layer was also identified.

1.0 INTRODUCTION

A programme of archaeological monitoring and recording was undertaken by Witham Archaeology during groundworks relating to the construction of a single four bedroom dwelling on land west of Bank House Farm, South Eau Bank, Throckenholt, Lincolnshire. The work was commissioned by Mr. N. Price to meet the requirements of a condition attached to planning permission granted by South Holland District Council. Attendance on site was required for the excavation of the foundations for the four bedroom dwelling on the 16th of September 2019.

The information in this document is presented with the proviso that further data may yet emerge. Witham Archaeology cannot, therefore, be held responsible for any loss, delay or damage, material or otherwise, arising out of this report. The document has been prepared in accordance with the Code of Conduct of the Chartered Institute for Archaeologists.

2.0 SITE LOCATION, TOPOGRAPHY & GEOLOGY (see Figs. 1 and 2)

The village of Throckenholt located in the parish of Sutton St. Edmund and in the administrative district of South Holland, lies *c*. 12km west of Wisbech and 25km south-east of Spalding. The site is centred on NGR TF 535735 309510.

Topographically, the site is located on Jurassic West Walton Formation and Ampthil Clay Formation Mudstone overlain by superficial deposits of Quaternary Tidal Flat Deposits clay and silts (British Geological Survey website).

3.0 ARCHAEOLOGICAL & HISTORICAL BACKGROUND

The site is located in the Lincolnshire Fens, an area that for much of prehistory was subjected to repeated marine transgressions which deposited thick layers of clays and silts within a salt marsh environment. Owning to changed climatic conditions, this area become available from the late Iron Age and Roman period first for saltmaking activities and later for settlement (Hayes and Lane, 1992).

During the Anglo-Saxon period, the coastline was marked by a series of villages running eastwards along a low ridge from Spalding, and including Moulton, Whaplode and Holbeach (British Geological Survey 1984). The low ridge would have provided slightly higher and drier ground more suitable for occupation, and the existence of these communities in the Anglo-Saxon period is confirmed by numerous land grants to Crowland Abbey, suggesting that the region was a relatively stable agricultural environment (Sawyer 1998).

An extensive survey of the Fenland (Philips 1970) identified numerous sites of cropmarks on the Fenland silts around the area of the site. These are thought to be dated to the Romano-British period.

Information in the Lincolnshire Historic Environment Record (HER) indicates that the site is located immediately to the north of the remains of a Romano British settlement (LCCHER MLI22301). Archaeological monitoring conducted in Cole's Bridge, *c.*600m to the west of site, revealed an undated ditch (LCCHER MLI85794). Further to the north cropmarks of probable Iron Age and Romano British date were identified from aerial photographs (LCCHER MLI20515). Artefactual evidence recovered in the area of Whaplode Drove suggests intensive salt production, probably during the early Roman period.

4.0 AIMS & OBJECTIVES

The principal objectives of the project, as set out in a Witham Archaeology specification of 12th of June 2018, were to:

- *allow the preservation by record of any surviving archaeological deposits and artefacts exposed by the development groundwork within the constraints imposed by the contractor's working methods, programme and development design.*
- *produce a project archive for deposition with the appropriate museum together with a client report.*
- *provide information for accession to the Lincolnshire Historic Environment Record*.

5.0 METHODOLOGY

The excavation of foundation trenches for the four bedroom dwelling was attended by an experienced archaeologist who supervised the groundworks and undertook the recording of archaeologically significant contexts as well recording current land usage at the site.

A photographic record of the stratigraphic sequence, showing specific archaeological features and deposits, as well as general site circumstances, was compiled in both digital RAW and black and white 35mm film formats. Section drawings and plans were produced at scales 1:10 or 1:20 as appropriate and individual context descriptions were made for each unit of stratigraphy using *pro forma* recording sheets.

6.0 RESULTS (Fig. 3, 4, 5 and 6; Plates 3, 4, 5, 6, 7, 8, 9 and 10)

The earliest deposit recorded was a firm blueish grey clay deposit (005), overlain by a layer of peat (004) *c.*0.1m thick. The peat was covered by firm blueish grey clay deposit (003), which was c.0.65m thick.

The latest clay (003) was cut by a possible Pit [007] in the eastern part of the site (Fig. 4; Plate 6). Pit [007] ran beyond the foundation trenches sections and was not fully exposed. However, the available evidence suggests that the feature was circular with concave sides and concave base, measuring c. 1.3m wide and 0.20m deep. It was filled by an orangey brown corky peat (006), from which no dating evidence was recovered. The feature was sealed by subsoil (002), which suggest an earlier date than other features on site.

Subsoil (002), an orangey brown clay measuring 0.3m thick, was cut by Pit [011] at the north-west corner of site (Fig 6; Plate 10). The pit was only partly exposed but was probably circular with concave sides and a concave base slopping down towards the east, measuring over 2.5m long and 0.36m deep. It was fill by an orangey brown corky peat (010), very similar to fill (006) of Pit [007].

Linear Ditch [012], which crossed the site from west to east and had concave sides and measured *c.*1.7m across by at least 0.45m deep (Figs. 5 and 6; Plates 7, 8 and 9). The feature was filled by a patchy orangey/reddish brown clay (008), with firm yellowish white clay. Ceramic Building Material (CBM) fragments, dated 13th to 15th century and 16th to 18th century, and a fragment of coal/cinder were recovered.

The topsoil was a firm dark grey clay containing occasional root and ceramic building material inclusions (001). Fragment of 19th century Buff ware, Pearlware and Black-glazed ware pottery and a 19th to early 20th century slate pencil were recovered from the deposit.

7.0 DISCUSSION & CONCLUSION

A post medieval possible field boundary and two undated possible pits were the only potentially archaeologically significant features recorded on site. The ditch appears to respect a dyke to the north of the site, which appears on historic maps from the First Series 1824 OS map.

The clays recorded are likely to correspond with periods of marine transgression in the area and the peat would have been form in a freshwater environment.

Despite the largely negative results of this trial trenching the potential for archaeological remains elsewhere in the area cannot be completely discounted.

8.0 ACKNOWLEDGEMENTS

The author would like to thank the Mr. N. Price owner of the property, for his interest and support in ensuring that the project was brought to a successful conclusion. Thanks are also due to Chris Ayers for the fieldwork, to Dale and Russell Trimble for editing this report, to Dr. Anne Irving for the Ceramic Finds specialist report and Gary Taylor for the Other Finds specialist report, and to staff at the Lincolnshire Historic Environment Record office, for assistance in locating background information for the site.

CONTEXT SUMMARY

Appendix A. Context Summary

Context	Description	Interpretation
001	Firm dark grey clay. Occasional CBM. c.0.15m thick	Topsoil
002	Loose to moderately firm orangey brown clay. Occasional small stone, flint and roots. c.0.3m thick	Subsoil
003	Firm blueish grey clay. Occasional roots and flints. 0.65m thick	Layer of clay
004	Loose black peat. 0.1m thick	Layer of peat
005	Firm blueish grey clay. 0.25m thick	Layer of clay
006	Loose orangey brown corky peat. 1.3m wide and 0.2m thick	Fill of Pit [007]. Somewhat organic peaty fill. Same as (010)
007	Irregular circular, 1.3m wide and 0.2m deep. Concave sides with a concave base	Cut of Pit
008	Firm orangey/reddish patchy brown clay. Occasional roots and CBM. 3.5m wide and 0.9m thick	Fill of Ditch [012]
009	Voided	Voided context
010	Loose orangey brown corky peat. 3.2m wide and 0.36m thick	Fill of Pit [011]. Somewhat organic peaty fill. Same as (006)
011	Irregular circular, 3.2m wide and 0.36m deep, with concave sides and concave base	Cut of possible Pit
012	Linear north-east south-west, 1.7m maximum width, over 0.45m deep	Cut of Ditch. Linear Ditch running across site

APPENDIX B

THE CERAMIC FINDS REPORT

Excavation at Throckenholt, Lincolnshire (THBH19)

THE CERAMIC FINDS

Dr Anne Irving

POTTERY

Introduction

All the material was recorded at archive level in accordance with the guidelines laid out in Slowikowski *et al.* (2001). A total of three sherds from a maximum three vessels, weighing 127g was recovered from the site.

Methodology

The material was laid out and viewed in context order. Sherds were counted and weighed by individual vessel within each context. The pottery was examined visually and using x20 magnification. This information was then added to an Access database. An archive of the pottery is included in Table 1.

Results

Table 1, Archive of the Pottery

Cxt	Cname	Full name	Form	NoS	NoV	W (g)	Part	Description	Date
001	NCBW	19th-century Buff ware	Bowl	1	1	99	Rim		
001	PEARL	Pearlware	Hollow	1	1	1	BS	Moulded	
001	BL	Black-glazed wares	Bowl	1	1	27	Base		17th to 18th
			TOTAL	**3**	**3**	**127**			

CERAMIC BUILDING MATERIAL

Introduction

All the material was recorded at archive level in accordance with the guidelines laid out by the ACBMG (2002). A total of nine fragments of ceramic building material, weighing 554g was recovered from the site.

Methodology

The material was laid out and viewed in context order. Fragments were counted and weighed within each context. The ceramic building material was examined visually and using x20 magnification. This information was then added to an Access database. An archive of the ceramic building material is included in Table 2.

Results

Table 2, Archive of the Ceramic Building Material

Cxt	Cname	Fabric	NoF	W (g)	Description	Date
008	BRK	Calcareous	1	435	Handmade; vitrified; salt surfaces; abraded	13th to 15th

APPENDIX C
OTHER FINDS REPORT

Appendix C

The Finds

By Gary Taylor

Artefacts recovered during investigations at Throckenholt, Lincolnshire, are reported, below.

The finds were examined and reported in accordance with CIfA guidelines (2014) and the *Lincolnshire Archaeological Handbook* (Lincolnshire County Council (2016).

Other Finds

Introduction

Two other finds weighing a total of 2g were recovered.

Results

Context	Material	Description	No.	Wt(g)	Context date
001	stone	Slate pencil	1	1	19th-early 20th century
008	Coal/cinder	Coal/cinder	1	1	
		TOTALS	2	2	

Provenance

The items were recovered from the topsoil (001), and a ditch fill (008).

Discussion

A slate pencil was recovered. These were used, generally by schoolchildren, with a slate writing board. Slate pencils were in common use in schools from at least as early as the 1840s until the early 20th century. They were also used, again in association with slate blackboards, for marking tallies or writing other details on industrial premises.

A cinder, probably a fragment of burnt coal, was also retrieved.

Potential and Recommendations

The finds are of limited potential and can be discarded.

Context Date Summary

The dating in the following table is based on the evidence provided by the finds detailed above.

Spot dates

Cxt	Date (Century AD)	Comments
010	19th-early 20th	Based on 1 stone
008	undated
