Figure 1 is a line graph showing the effect of the concentration of the initiator on the polymerization of 1,3-bis(4-vinylphenyl)propane (1,3-BVP) in the presence of 1,1,1-trichloroethane (TCE) at 60°C. The y-axis is labeled 'Conversion (%)' and ranges from 0 to 100. The x-axis is labeled 'Initiator concentration (mol/L)' and ranges from 0 to 0.002. There are two data series: one represented by open circles (○) and another by open squares (□). Both series show a rapid increase in conversion from 0 to about 80% as the initiator concentration increases from 0 to 0.001 mol/L, after which the conversion levels off. The series with open circles (○) generally shows higher conversion than the series with open squares (□) at higher initiator concentrations.
